	first emission		

2. Explanation of Terms and Concepts

About Features used to produce this forecast

We produced this forecast using the following specific source:

1. astronomical solar system data (same day - 0 shift)
2. seismic sensor GPS data (60 days shift)
3. tropospheric data (60 days shift)

The Purpose is to demonstrate the validity of using GPS + TROPO data several weeks before a seismic event.

Time series sharpness achievable by astronomical data only can be up to 7 days.

This study demonstrates that using augmented data in past geophysical observations can rise the time line sharpness up to 24 hrs and more.

About Graph system

*Note: **trend** graph*

Forecast graph and tables refer to a base value, against it.

For instance if a value of 37 per latitude is the base line and graph value is 0% it means that the location estimated for that period of time is UNDER 37.

Another example is for magnitude graph, with baseline Mw 7.0, 0% means no risk detected, and 100% means high risk detected

About Time Slot

*Note: each date point represents **the beginning of the time slot***

For instance if a forecast time point is on 2025-01-01 and the graph resolution is 7 days, it's a forecast for 2025-01-01 until 2025-01-06 (UTC)

3. Forecasts

3.1 M 7.7+ Seismic Energy Forecast (possible earthquake or eruption), res:1 week, UTC (focus: cycle4)

⚠ Higher Risk Detected for Following Dates:

- 1. from 2025-09-21 to 2025-09-28 (UTC) - Risk Value: 0.602
- 2. from 2025-10-12 to 2025-10-19 (UTC) - Risk Value: 0.534
- 3. from 2025-12-07 to 2025-12-14 (UTC) - Risk Value: 0.529

Each date represent the BEGINNING of time slot

This seismic energy forecast highlights potential earthquakes or eruptions in World.

Bodies are represented by their NAIF ID (unique identifiers for celestial bodies from NASA/JPL); observers use geo_lat;lon;height schema. Ephemerides are Horizons fields; operations are aggregations like min/max.

6. Summary and Conclusion

Summary of Findings

Elevated seismic energy suggests potential earthquakes or eruptions in World.
Peak dates: 2025-09-21, 2025-10-12, 2025-12-07 (UTC).

Conclusions

Increased seismic energy indicates potential earthquakes or eruptions for
2025-09-21, 2025-10-12, 2025-12-07 in World.

Even if the risk appears slight or moderate, preparation is necessary because the epicenter could be near your location. A separate report is required to estimate its position.
